

**Keep your warehouse safe
and compliant with regular racking
inspections by Jungheinrich.**

Racking systems are a critical part of warehouse operations - but when was the last time yours were professionally inspected?

JUNGHEINRICH

Unsafe or damaged pallet racking can lead to serious safety risks, operational downtime, and costly repairs. That's why regular inspections are not just recommended - they're essential.

Why Racking Inspections Matter:

- Identify structural damage, misalignment, or corrosion
- Ensure compliance with SEMA and HSE safety standards
- Under UK law (PUWER 1998), pallet racking must be regularly inspected and maintained by competent professionals
- Verify load notices and weight limits
- Prevent accidents and protect your workforce
- Maintain insurance and regulatory compliance

What We Offer:

At Jungheinrich, we provide **SEMA-compliant inspections** that help you stay safe and compliant: The inspection includes:

- A comprehensive visual assessment of all racking systems
- A detailed report with photographic evidence and risk ratings
- Clear recommendations for remedial action
- Optional repair and maintenance services

Please note: if you do require our pallet racking components for repair, you will be dealing directly with the manufacturer and will receive the best price in the UK!

Jungheinrich.
Your perfect racking partner.

Did you know we also offer a Racking Safety & Inspection Training Course?

The aim of the course is to provide the information and tools to enable you to **take 'ownership' and safely manage your storage racking systems and goods stored thereon by developing your own in-house expertise.** By adopting best practice, you can minimise the potential risk of injury to personnel, damage to goods and interruption to business. Annual racking inspections must still be carried out by an external competent person.

The 1 day course would be held at your premises for up to 6 delegates and includes both a practical and classroom aspect. Accredited instructors deliver an externally accredited RoSPA Assured Course, conduct all instruction and provide certification valid for 3 years.

Programme includes:

- The requirements for rack safety inspections
- Regulations/guidelines/responsibilities
- Identifying and classifying damage
- Understanding racking components/assessing damage
- Practical session - examples of damage/practical inspection
- Remedial actions
- Reference material
- Final assessment
- Certification
