

# Safety is child's play when you have everything covered.

360-degree protection by Jungheinrich.

Our many safety solutions cover all five risk areas in warehouse environments. This overview will show you how our 360-degree protection covers people, goods, warehouse equipment, machines and data.

## 1. Protecting people.

Because people are most important.

Our end-to-end safety concept is something you can fully rely on. We offer a number of vehicle options to protect your employees against collisions with forklift trucks or other accidents in the warehouse. And because the health of your employees is close to our hearts, we ensure your workplace is designed based on ergonomic principles, so your drivers can always work safely, ergonomically and efficiently.

## 2. Protecting goods.

Reliable protection for your valuable goods.

Your stored goods are a valuable asset. Different assistance systems help you to protect them properly, while saving both time and costs. This means you not only protect your goods and your employees, but also your warehouse productivity and ability to deliver.

## 3. Protecting warehouses and equipment.

Effectively prevent risks in the warehouse.

Our preventive services help to anticipate and avoid risks caused by damaged warehouse equipment. Your processes stay safe and your investments are protected.

## 5. Protecting data.

Ensure everything stays where it belongs.

In times of increasing digitalisation and connectivity, solutions for downtime protection and data security should be part of every safety strategy. We believe it is very important to make sure our digital solutions meet maximum safety requirements. Independent certification of our software and web applications means hackers don't get a chance. Your valuable company data and information will enjoy lasting and effective protection.

## 4. Protecting machinery.

Significantly reducing accident numbers.

With all kinds of features and regular maintenance, we help you to minimise accidents involving forklift trucks, thus ensuring their long-term availability. As a result, you not only protect your employees, but also lower repair and maintenance costs as well as your overall costs.
